- 7 Conclusion

- Original IP model [Bellows and Petersen, *Annals of Improbable Research*, 2012].
- Two-stage algorithm using tabu search [Lewis, *WorldComp International Conference Proceedings*, 2013].
- Improved IP model [Lewis and Carroll, *Journal of the Operational Research Society*, 2016].

Existing Methods

Two-stage algorithm using tabu search [Lewis, 2013]

Build a graph where nodes represent groups, edges represent relations, and colors represent tables.

Existing Methods

Two-stage algorithm using tabu search [Lewis, 2013]

Build a graph where nodes represent groups, edges represent relations, and colors represent tables.

- Stage 1: Color nodes to find an initial feasible solution

Existing Methods

Two-stage algorithm using tabu search [Lewis, 2013]

Build a graph where nodes represent groups, edges represent relations, and colors represent tables.

- Stage 1: Color nodes to find an initial feasible solution
- Stage 2: Improve this feasible solution with a tabu search

maximize 

Branching heuristic (similar to *best fit decreasing*):

- 1 Pick the largest group yet unassigned
- 2 Assign that group at the best possible table
- 3 If no table has enough room, open a new table

Branching heuristic (similar to *best fit decreasing*):

- 1 Pick the largest group yet unassigned
- 2 Assign that group at the best possible table
- 3 If no table has enough room, open a new table

Large Neighborhood Search (LNS):

- Freeze $\sim 1/3$ of the tables for 10s
- The best tables are more likely to be frozen

IP Model B

Master Problem

$$\begin{array}{ll}\min & \sum_{S \in \mathcal{S}} \alpha_S x_S \\ \text{s.t.} & \sum_{S \in \mathcal{S}: i \in S} x_S = 1 \quad \forall i \in \mathcal{G} \quad (\gamma) \\ & \sum_{S \in \mathcal{S}} x_S = m \quad (\zeta) \\ & \sum_{S \in \mathcal{S}} \beta_S x_S \geq d_{\min} \quad (\gamma) \\ & \sum_{S \in \mathcal{S}} \beta_S x_S \leq d_{\max} \quad (\delta) \\ & x_S \in \{0, 1\} \quad \forall S \in \mathcal{S}\end{array}$$

$$\max \quad \sum_{i=1}^n y_i + m\zeta + d_{\min}\gamma + d_{\max}\delta$$

s.t.

$$\sum_{i \in S} y_i + \zeta + \beta_S(\gamma + \delta) \leq \alpha_S \quad \forall S \in \mathcal{S}$$

$$y_i \text{ free} \quad \forall i \in S$$

$$\zeta \text{ free}$$

$$\gamma \geq 0$$

$$\delta \leq 0$$

IP Model B

Pricing Problem (objective)

$$z_i := \begin{cases} 1, & \text{if group } i \text{ is packed into the new table/pattern,} \\ 0, & \text{otherwise.} \end{cases}$$

IP Model B

Pricing Problem (objective)

$$z_i := \begin{cases} 1, & \text{if group } i \text{ is packed into the new table/pattern,} \\ 0, & \text{otherwise.} \end{cases}$$

$$\max \quad \sum_{i=1}^n y_i^* z_i + \zeta^* + \beta(\gamma^* + \delta^*) - \sum_{i=1}^{n-1} \sum_{j=i+1}^n c_{ij} z_i z_j \quad \text{if } \gamma^* + \delta^* < 0$$

$$\max \quad \sum_{i=1}^n y_i^* z_i + \zeta^* - \beta(\gamma^* + \delta^*) - \sum_{i=1}^{n-1} \sum_{j=i+1}^n c_{ij} z_i z_j \quad \text{if } \gamma^* + \delta^* > 0$$

IP Model B

Pricing Problem (constraints)

$$z_i + z_j \leq 1$$

$$\forall i, j \in \mathcal{G} : c_{ij} = \infty$$

IP Model B

Pricing Problem (constraints)

$$z_i + z_j \leq 1$$

$$\forall i, j \in \mathcal{G} : c_{ij} = \infty$$

$$\sum_{i=1}^n w_i z_i \geq \ell$$

$$\sum_{i=1}^n w_i z_i \leq u$$

IP Model B

Pricing Problem (constraints)

$$z_i + z_j \leq 1$$

$$\forall i, j \in \mathcal{G} : c_{ij} = \infty$$

$$\sum_{i=1}^n w_i z_i \geq \ell$$

$$\sum_{i=1}^n w_i z_i \leq u$$

$$\sum_{i=1}^n w_i z_i - w/m \leq \beta$$

$$\sum_{i=1}^n w_i z_i - w/m \geq -\beta$$

IP Model B

Pricing Problem (constraints)

$$z_i + z_j \leq 1$$

$$\forall i, j \in \mathcal{G} : c_{ij} = \infty$$

$$\sum_{i=1}^n w_i z_i \geq \ell$$

$$\sum_{i=1}^n w_i z_i \leq u$$

$$\sum_{i=1}^n w_i z_i - w/m \leq \beta$$

$$\sum_{i=1}^n w_i z_i - w/m \geq -\beta$$

$$z_i \in \{0, 1\}$$

$$\forall i \in \mathcal{G}$$

- 1 Solve the continuous relaxation of the RMP to get the dual values.

- 1 Solve the continuous relaxation of the RMP to get the dual values.
- 2 Solve the PP to generate the most promising new table/column (S^*).

- 1 Solve the continuous relaxation of the RMP to get the dual values.
- 2 Solve the PP to generate the most promising new table/column (S^*).
- 3 Determine if this new column should be added to the RMP. If yes, compute α_{S^*} and β_{S^*} , and add column S^* to the RMP before going back to step 1. Otherwise, the current solution of the continuous relaxation of the RMP is the lower bound of the initial problem.

- 4 IP Model A
- 5 IP Model B
- 6 Results
- 7 Conclusion**

Conclusion

Metaheuristics

- + Good early solutions
- + Scales well

Conclusion

Metaheuristics

- + Good early solutions
- + Scales well
- No proof of optimality
- Poor balance

Conclusion

CP Model

- + Very good early solutions
- + Proves optimality for small instances
- + Quickly proves optimality or infeasibility for all instances when there are no costs

- + Very good early solutions
- + Proves optimality for small instances
- + Quickly proves optimality or infeasibility for all instances when there are no costs
- Hard to optimize with costs
- Limited symmetry breaking

Conclusion

IP Model A

- + Simple model
- + Proves optimality for small instances

Conclusion

IP Model A

- + Simple model
- + Proves optimality for small instances
- Inefficient
- Limited symmetry breaking

Conclusion

IP Model B

- + Near-optimal solutions
- + No symmetry
- + Provides a good lower bound

Conclusion

IP Model B

- + Near-optimal solutions
- + No symmetry
- + Provides a good lower bound
- Complex
- No proof of optimality
- Poor early solutions
